

335. Correct. The answer is true. First find the value of the crude oil by taking the share of each product times the product price and adding together. From this value of the product subtract the refinery margin and transport cost. Then the netback price would be $=0.62*55 + 0.23*42 + 0.10*31 + 0.05*25 - 6 - 2.49 = \39 .
